Titan I was the Air Force's first multi-stage intercontinental ballistic missile, and a vital part of America's nuclear arsenal in the years 1961-1965. Designed and built by the Glen L. Martin Company (later Martin Marietta), the HGM-25A/SM-68A missile

was the first in a series of Titan rockets. Unlike its later siblings, Titan I utilized non-storable and highly volatile LOX and RP-1 as its propellants. As a result the missile had to be fueled prior to launch - a process that took roughly fifteen minutes. It would then be lifted to

the surface by an elevator for launch, a process that made it vulnerable to an enemy first strike. The first successful Titan I launch took place in February, 1959. Within a year the first of 54 missiles were delivered to one of what would eventually be six

USAF squadrons. The underground silos that made up the Titan I's launch complexes represented a great leap forward from the "coffin type" semi-hardened containers used to protect the Atlas ICBM. Equipped with an underground control

center, powerhouse, antenna silos for guidance radars, and a missile silo fitted with an enormous elevator, the Titan I's design offered unparalleled protection to the launch crew. Yet the fueling protocol and surface-launch design limited its appeal to the Air Force.

The first ICBM to be developed and deployed by the United States, the Atlas had a range of 5500 nautical miles and could achieve a speed of 15,500 mph. Depending on configuration, it could be equipped with either a W-49 (1.45

megaton) or W-38 (4.5 megaton) thermonuclear warhead. The Atlas' development can be traced to a series of research and development studies performed in the wake of WWII by the Convair company. These led to the company winning a contract in

1951 for a long range missile. The three-engine XSM-65A design that eventually emerged featured a thin skin, inflated by internal fuel pressure like a balloon, and had "one and a half" stages. In this configuration, both the main booster and sustainer engines

ignited at lift-off, with the boosters dropped in flight. (This unique feature was intended to make certain the sustainer engine could fire at high altitudes, something later determined to not be a problem). The missile burned kerosene and liquid oxygen fuel,

and relied on a radio-command / inertial guidance system. After some teething problems including the loss of the prototype Atlas, the missile flew successfully on December 17, 1957. A little under two years later, the first USAF Atlas ICBM squadron consisting of

three missiles on unprotected pads was activated at Vandenburg AFB. Subsequent deployments featured hardened "coffins" in which the missile would be stored horizontally. After a launch order was issued, the Atlas would be raised, fueled, and launched - a

hazardous process that took about fifteen minutes. The system's inherent vulnerability and long reaction time eventually led the Air Force to construct silos similar to those used with the Titan I, which lowered the response time considerably. The use of volatile

fuel mixtures in the confined silo environment proved to be extremely dangerous however, and led to four catastrophic accidents. As second generation missiles came on the scene such as the Titan II and Minuteman, Atlas became obsolete. By April 1965,

all Atlas ICBMs were phased out. At the peak 129 of the missiles were deployed, and nearly 350 were built during the program. Many of these would be recycled as launch vehicles for satellites. Notably, members of the Atlas family placed four of America's
